DENTISTRY

One hundred years from now, people will not look back and marvel at our world's artistic and scientific achievements. Instead, they will be appalled by what we did to our planet. It doesn't have to be that way. Adopting a regenerative way of thinking can reestablish the indelible bonds that connect everyone and everything on Earth. Human and ecological health are inextricably connected, yet too often we talk about them separately. We are also led to believe that to be sustainable means having to adopt a less satisfying lifestyle. No one aspires to be uncomfortable.

The sustainability efforts initiated at Phipps Conservatory and Botanical Gardens in Pittsburgh, Penn., are holistic, replicable, beautiful, and based on recognizing the vital connections between people, plants, health and the planet. This regenerative-based way of thinking influences the organization's actions and programs, particularly those focused on awakening children to nature, and promoting human and environmental wellbeing. We can—and must—create places and lifestyles that are better for people and the planet.
